Store System User Manual

Overview

The Store system is where stores run their daily operations: the operations coach AI, store reports, stock counts and ordering, utility bills, repairs, staff scheduling and the POS. Open it from the office Company Portal via "Store Operations" (URL /store).

Feature	URL	What it does
Store Management Coach AI	/store-coach	10-layer root cause diagnosis, workstation flow, hygiene and 90-second cleaning, service coaching, on-site vision AI
Quick Diagnostic AI	/repair?tab=ai&mode=store	No-disassembly troubleshooting for bar equipment and POS; one-click repair request if it can't be fixed
Store Reports	/store-reports	Import POS and inventory data; see revenue, cups, purchases and stock; usage variance analysis
Inventory & Ordering	/store-inventory	Daily counts, automatic order sheets, purchase batches and expiry, losses, safety stock

Feature	URL	What it does
Utility Bills	/store-bills	Monthly bills and receipt photos, sent straight to Finance
Store Repairs	/repair	Repair tickets, maintenance AI, equipment manuals, equipment ledger
Store Scheduling	/shift	Create schedule periods, staff enter availability, auto-suggest and send schedules
Store POS	/pos	Stores and terminals, menu editing, order management, order kiosk

Access

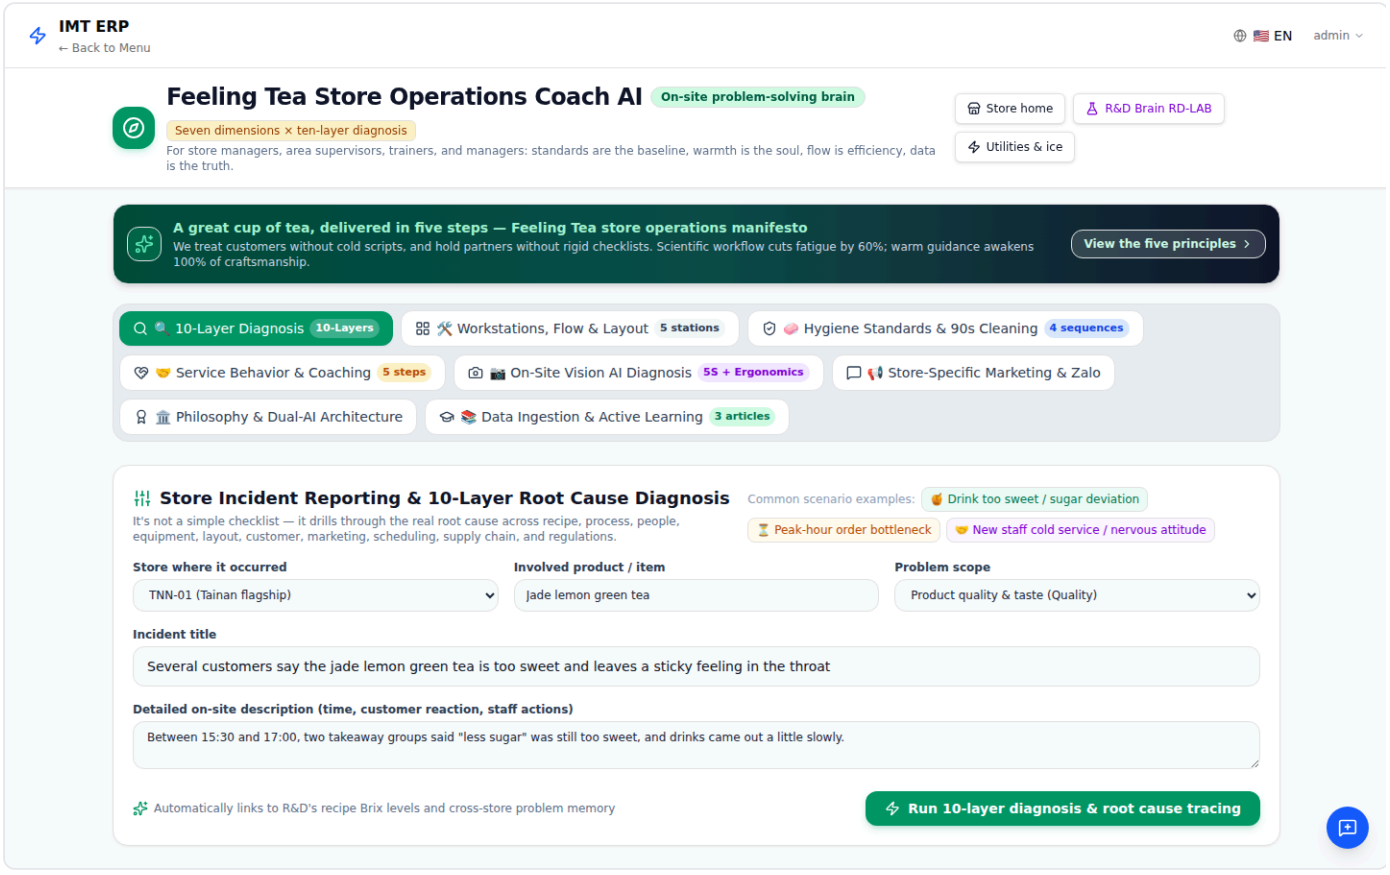

1. Only members of the Store unit can use it; anyone else sees a message that it is restricted to the Store unit.
2. Stores are always picked from a dropdown showing "code · name" (for example "YL · Yên Lãng"), taken from the store records.
3. An account's store scope is set in HR: staff with "own store only" see only their store and can't switch; a manager with "Managed stores (multiple)" sees only those stores in the dropdown and can switch between them; without "own store only" every store is available.
4. The "Store Leader" unit can only use Store Scheduling: shifts and staff evaluation for their own (or managed) stores.
5. Switch between Traditional Chinese, English and Vietnamese at the top right; AI replies use the language you pick.

Store Management Coach AI

For store managers, area supervisors and store trainers: it finds the root cause of problems on the floor and suggests how to fix them. Tabs at the top:

Tab	Content
10-Layer Diagnosis	Report an issue; AI looks for the root cause across ten layers: recipe, process, staff, equipment, flow, customers, marketing, scheduling, supply chain and regulations
Workstations, Flow & Layout	Three standard store layouts, five workstations and 45 cm ergonomics
Hygiene Standards & 90s Cleaning	Three-colour cloth rule and four 90-second flash cleaning sequences

Tab	Content
Service Behavior & Coaching	Customer service standards, five-step coaching method, staff and manager competencies
On-Site Vision AI Diagnosis	Upload a photo; AI checks 5S, cloth colours, syrup nozzles and expiry labels
Store-Specific Marketing & Zalo	Each store's Zalo Official Account and broadcasts
Philosophy & Dual-AI Architecture	Business philosophy, link with the R&D Brain, company regulations
Data Ingestion & Active Learning	Feed material for the coach AI to learn from

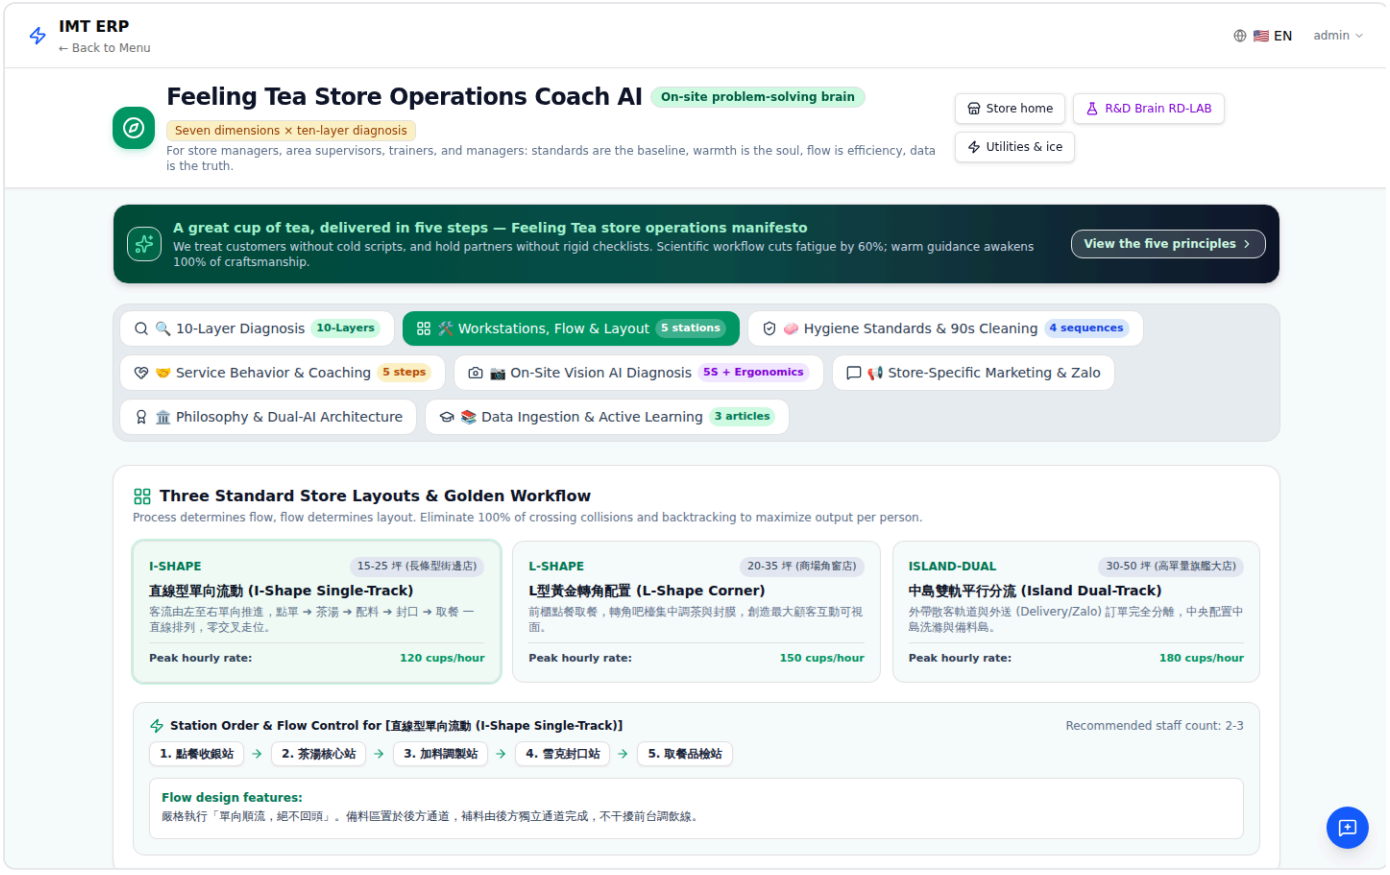

10-Layer Diagnosis

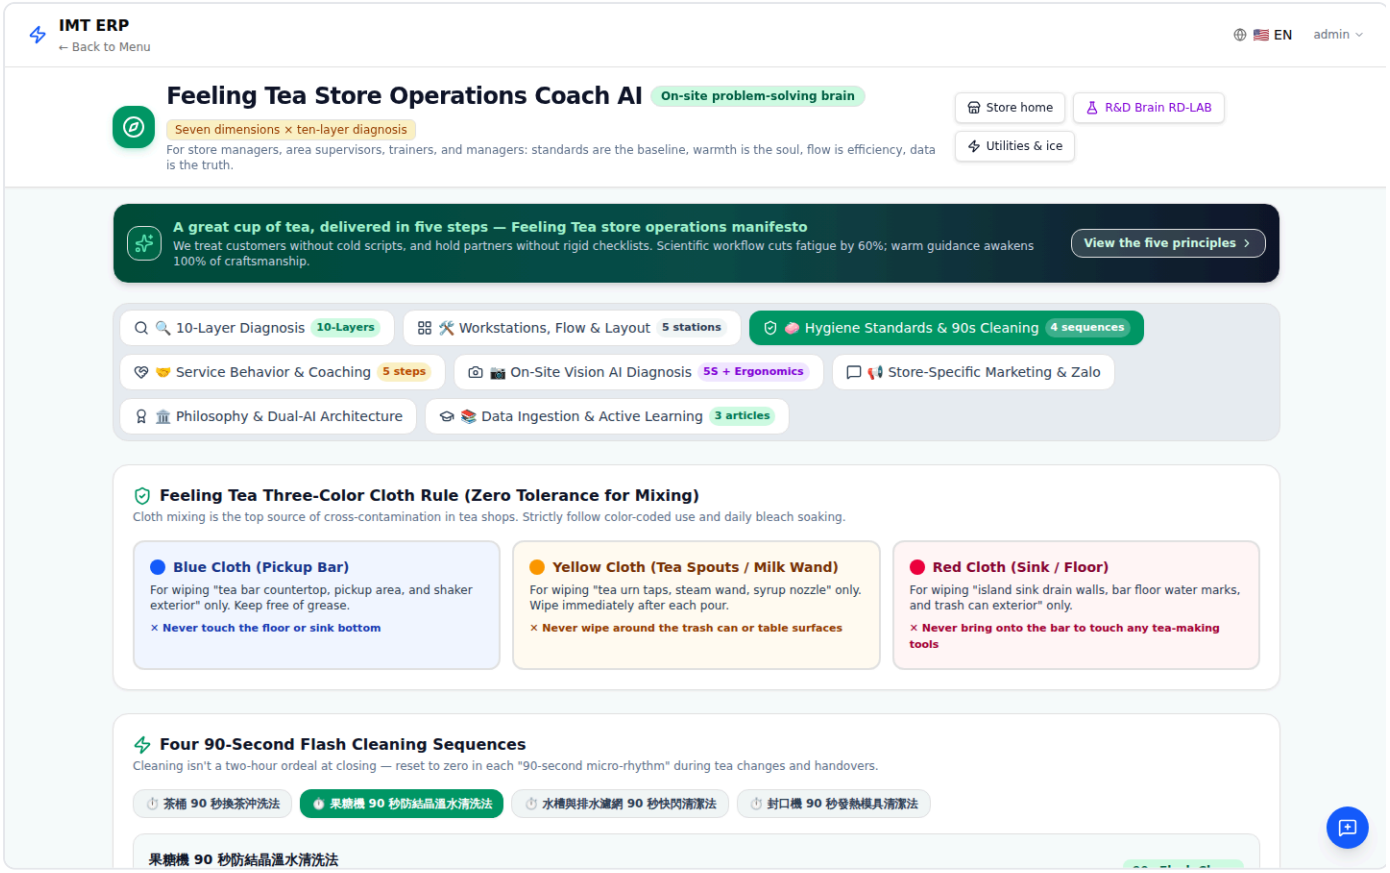

1. Click a common scenario at the top (drink too sweet, orders backing up at peak time, new staff cold with customers) to fill in an example.
2. Choose the store, then fill in the product, problem area and issue title, and describe what happened (time, customer reaction, what staff did).
3. Click "Run 10-layer diagnosis & root cause tracing". The system links in recipe sugar levels from the R&D Brain and past cases from other stores.

4. The result covers the root cause, the R&D standard recipe (°Brix, syrup, water temperature), actions for the next 15 minutes, longer-term prevention, the ten-layer analysis (click a layer for findings, evidence and remedy), a five-step coaching script and similar cases from other stores.

Workstations and hygiene

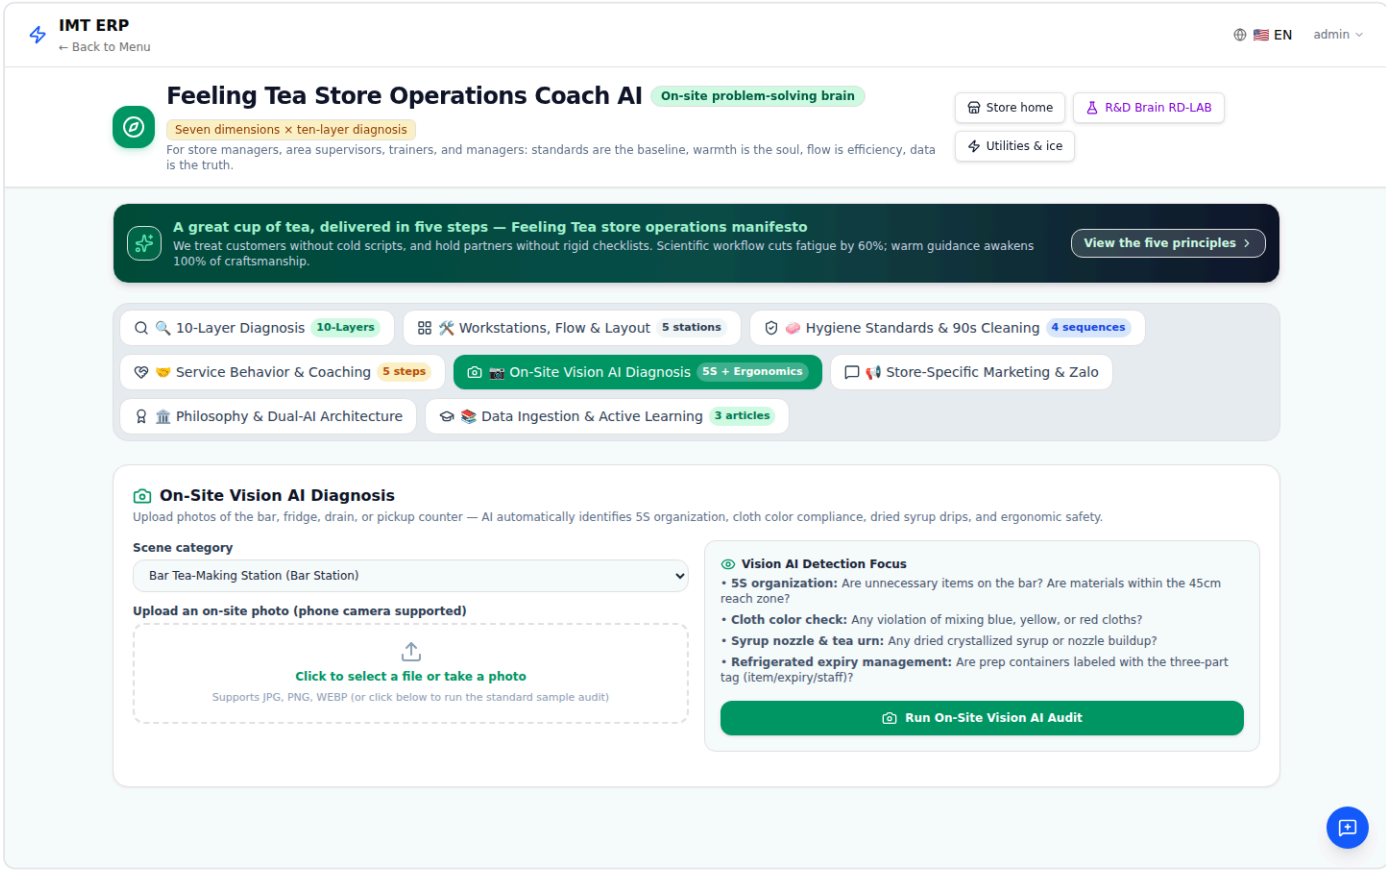

The workstation tab covers three standard layouts (I-shape single track, L-shape corner, island dual track) with workstation order, peak hourly output and flow notes, plus each workstation's role, ergonomics, equipment and common mistakes.

The hygiene tab sets the three-colour cloth rule: blue for the serving bar, yellow for tea taps and steam wands, red for sinks and floors. They are never mixed. Each of the four 90-second flash cleaning sequences has its timing, timed steps and pass standard.

On-Site Vision AI Diagnosis

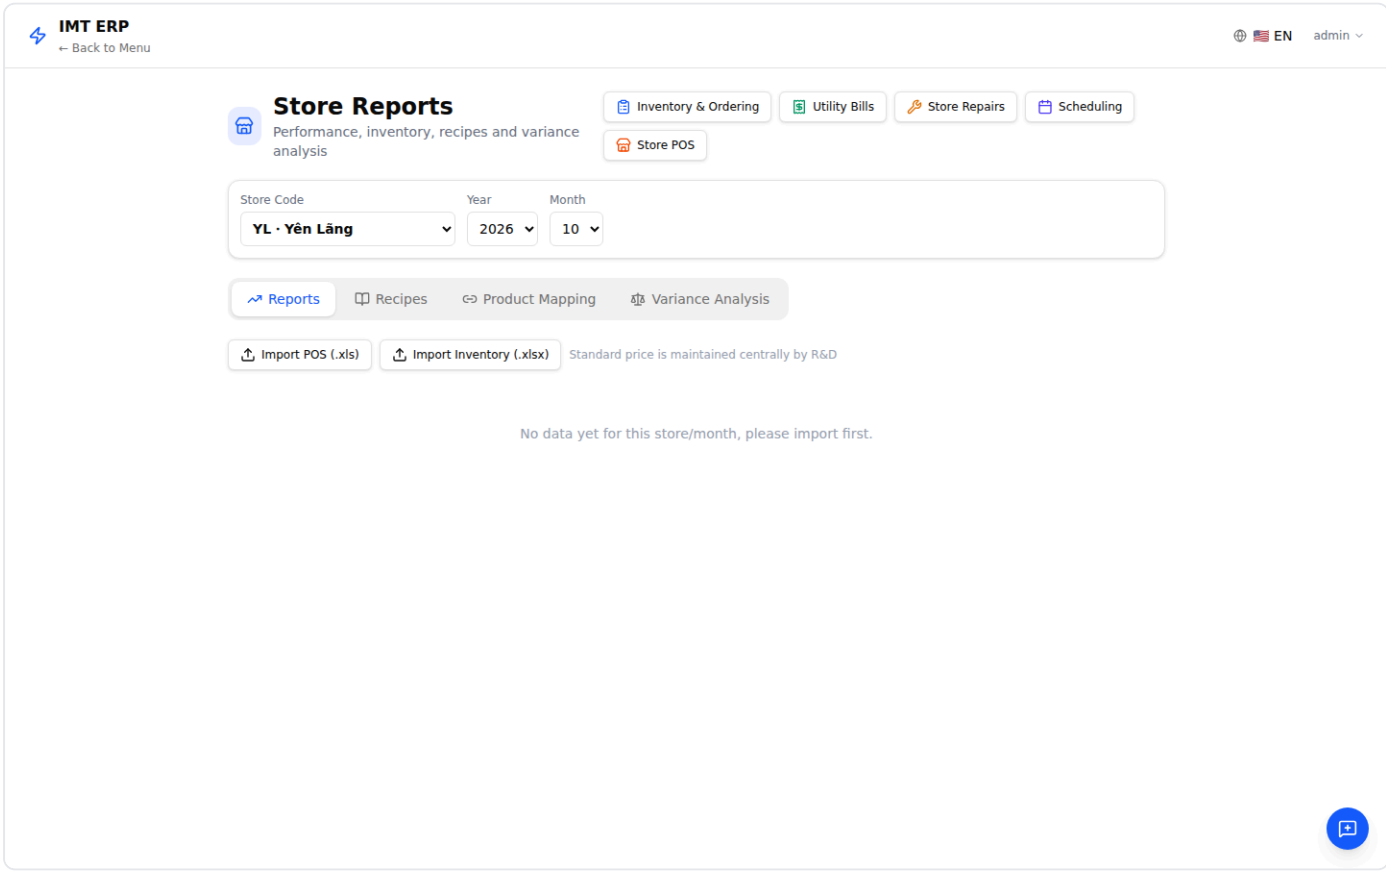

1. Choose the scene type (for example the bar station).
2. Upload a photo; on a phone you can take it directly (JPG, PNG, WEBP).
3. Run the check. AI returns a 5S score, food safety compliance rate, ergonomic risk, the location of each problem with fixes, and coaching tips for the supervisor.

Company regulations

At the bottom of the "Philosophy & Dual-AI Architecture" tab you can send new rules or change existing ones. Enter the rule name and content and submit; the coach AI cites them in diagnoses.

AI diagnoses and suggestions are support only. A manager or supervisor should confirm on site before acting.

Store Reports

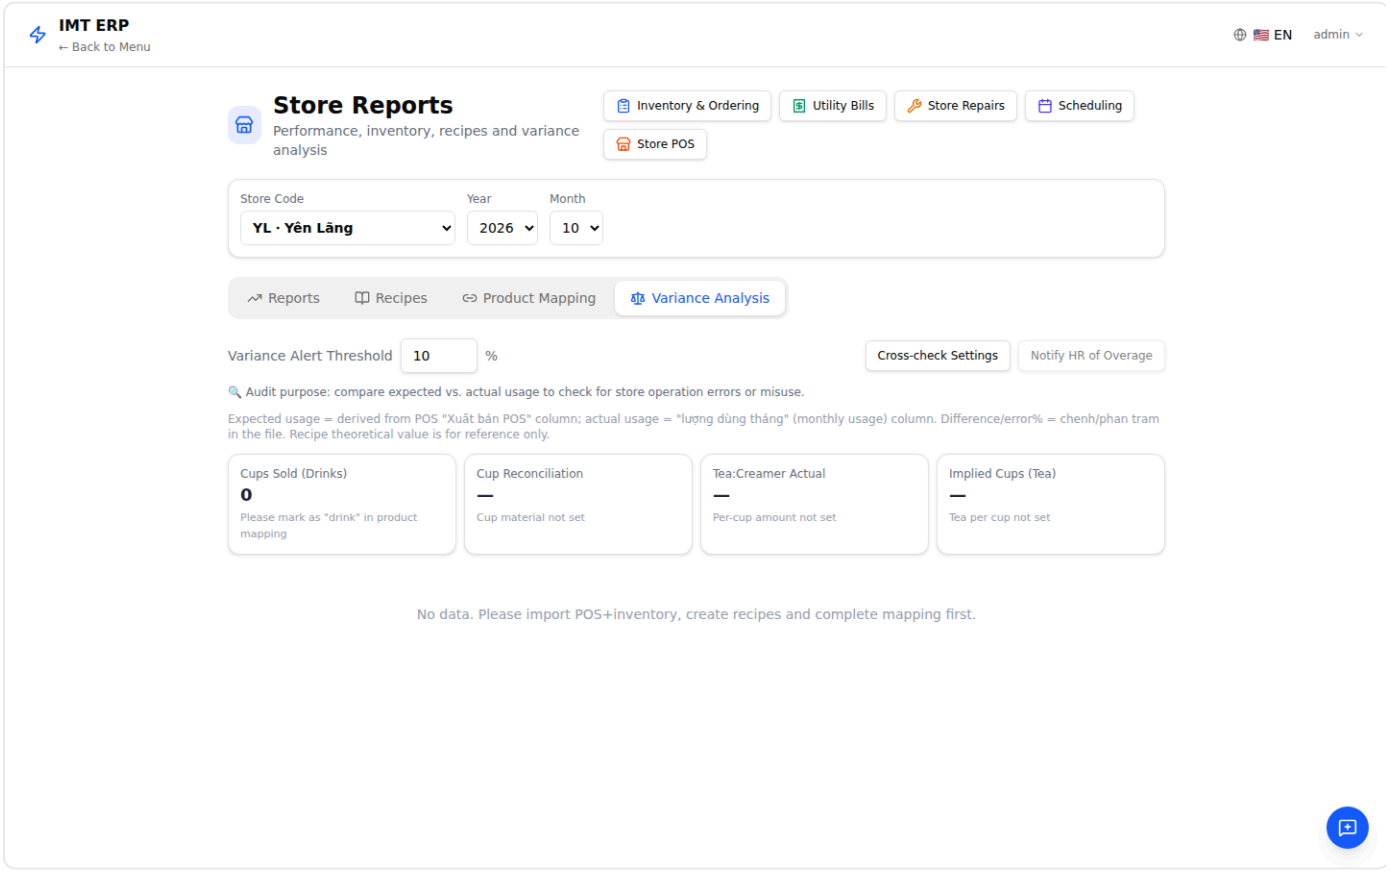

1. Pick the store from the dropdown (for example "YL · Yên Lãng") and choose the year and month.
2. On the "Reports" tab, click "Import POS (.xls)" to upload the POS sales file and "Import Inventory (.xlsx)" to upload the IVT inventory file.
3. You then see revenue, total cups, purchase spending and closing stock value, plus sales detail (product, cups) and inventory detail (opening, in, out, remaining, purchase value).

Other tabs:

- **Recipes**: the store's recipe list with quantity per cup. Standard prices are maintained centrally by R&D.
- **Product Mapping**: link each POS product to a recipe and mark it Drink or Topping. Topping recipes can use negative values for the base they replace (for example −tea, −creamer).

Variance Analysis

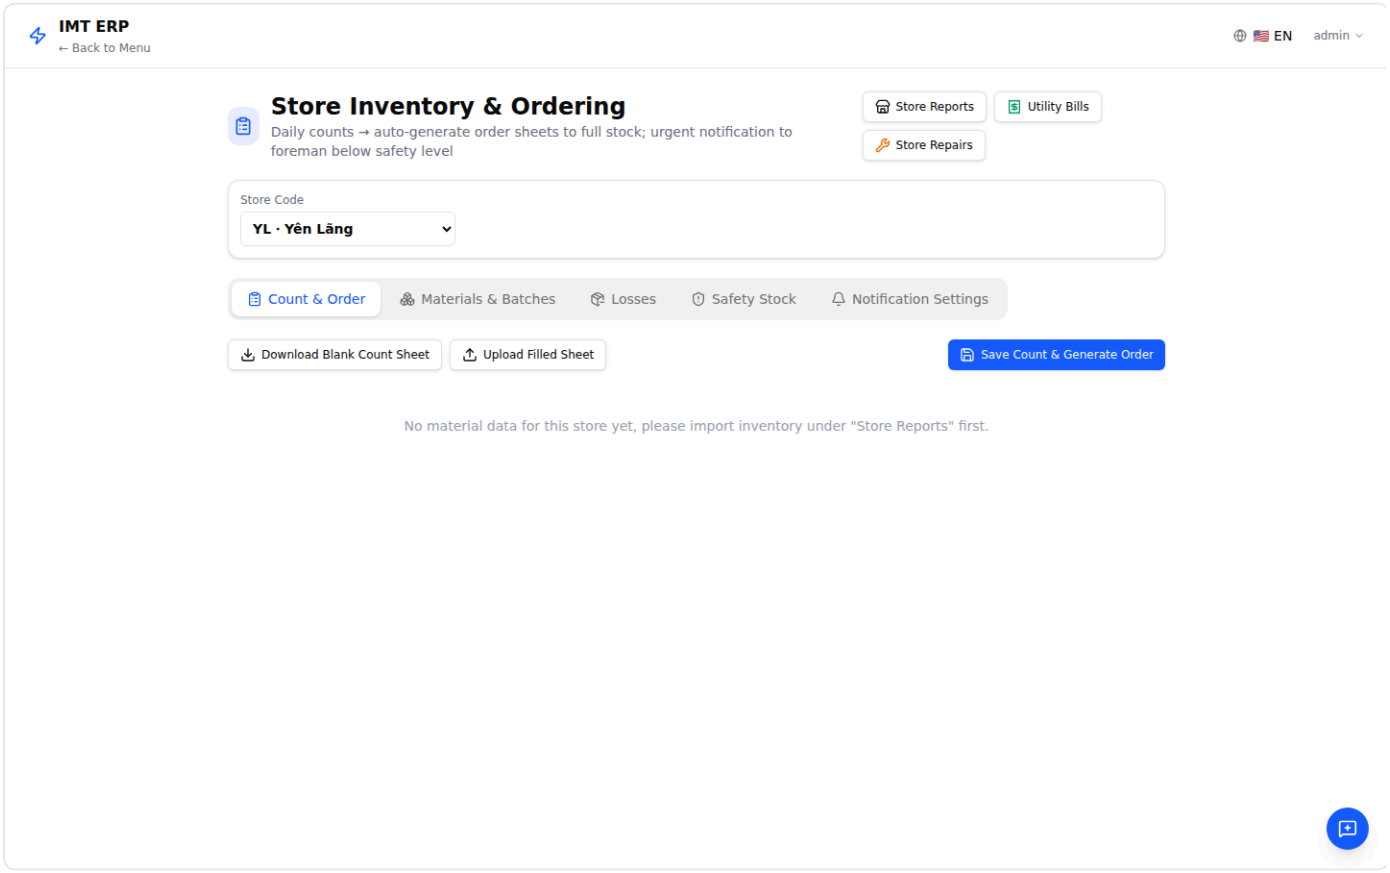

Compares the expected usage (IVT "Xuất bán POS", worked out from orders) with actual usage (the monthly "lượng dùng tháng"), to check whether the store is operating correctly.

1. Set the "Variance Alert Threshold" (%). Ingredients above it are marked "Abnormal Over", with the estimated money lost.
2. "Cross-check Settings" sets the cup, tea and creamer ingredients and per-cup amounts, used for cup reconciliation, tea-to-creamer ratio and implied cups.
3. "Topping Displacement Possibility Analysis": extra toppings displace the base, so lower-than-expected usage is often explained by them. What can't be explained is marked as suspected shortage or waste.
4. Click "Notify HR of Overage" to send the over-threshold items to HR.

Data appears only after POS and inventory files are imported, recipes are set up and products are mapped.

Inventory & Ordering

Choose the store first (its inventory must already be imported in Store Reports).

Count & Order

1. Click "Download Blank Count Sheet", fill it in and click "Upload Filled Sheet", or type the counted quantities on screen.
2. Click "Save Count & Generate Order". The system works out order quantities up to full stock; items below safety stock are marked "Urgent" and the foreman is notified.
3. Download the order sheet, or the IVT count and IVT order import files, then use the links to upload them to IVT.

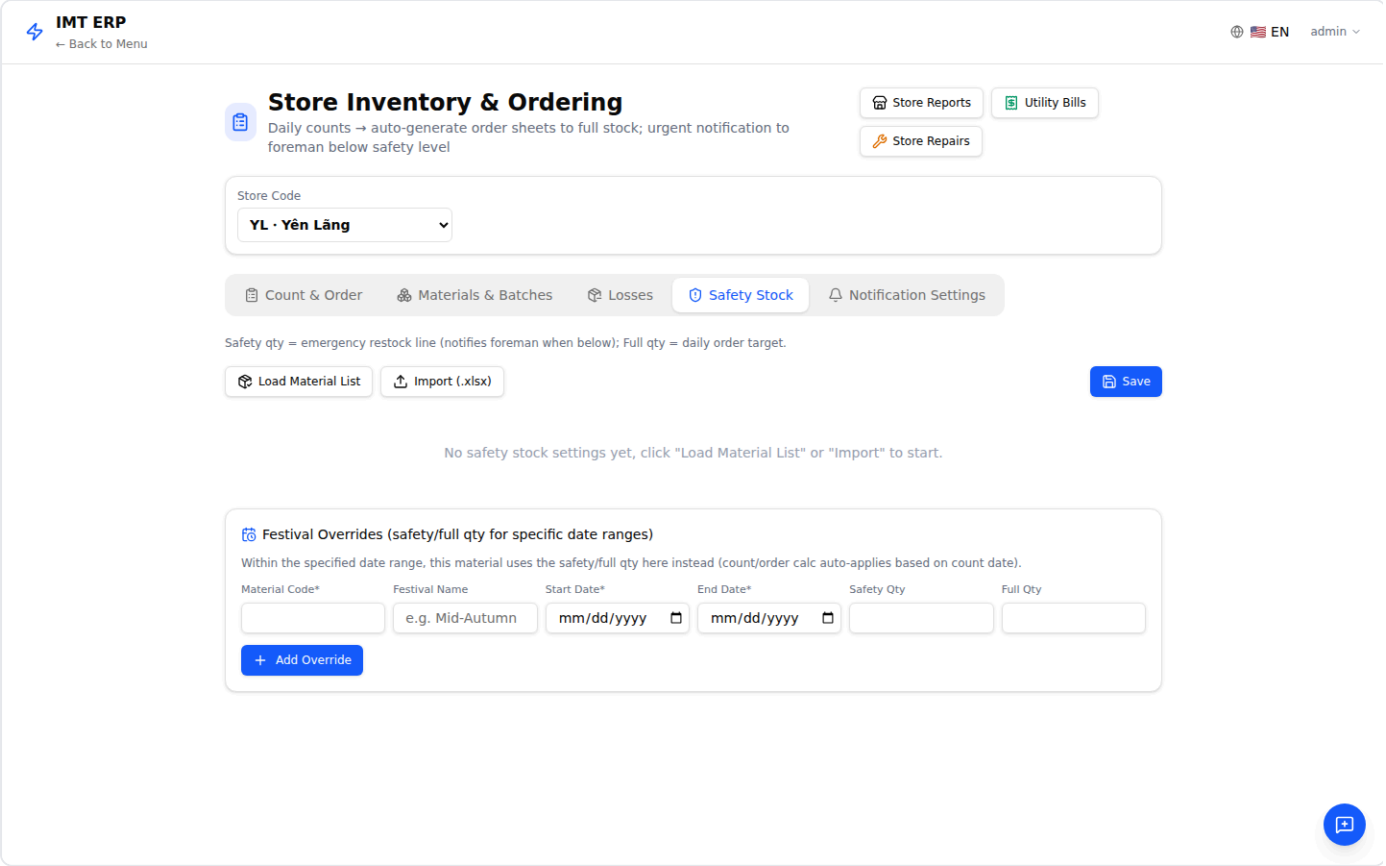

Materials & Batches

Record each delivery batch with its own expiry date (material code, purchase date, expiry date, quantity), by hand or by uploading a batch sheet. Reminders go out in stages before expiry, based on the notification settings. For an expired batch, click "Scrap and log as loss"; stock is reduced automatically.

Losses

Record items thrown away because they expired, were damaged or for another reason; stock is reduced and the record kept. IVT has no upload for losses, so enter them in IVT by hand as well.

Safety Stock

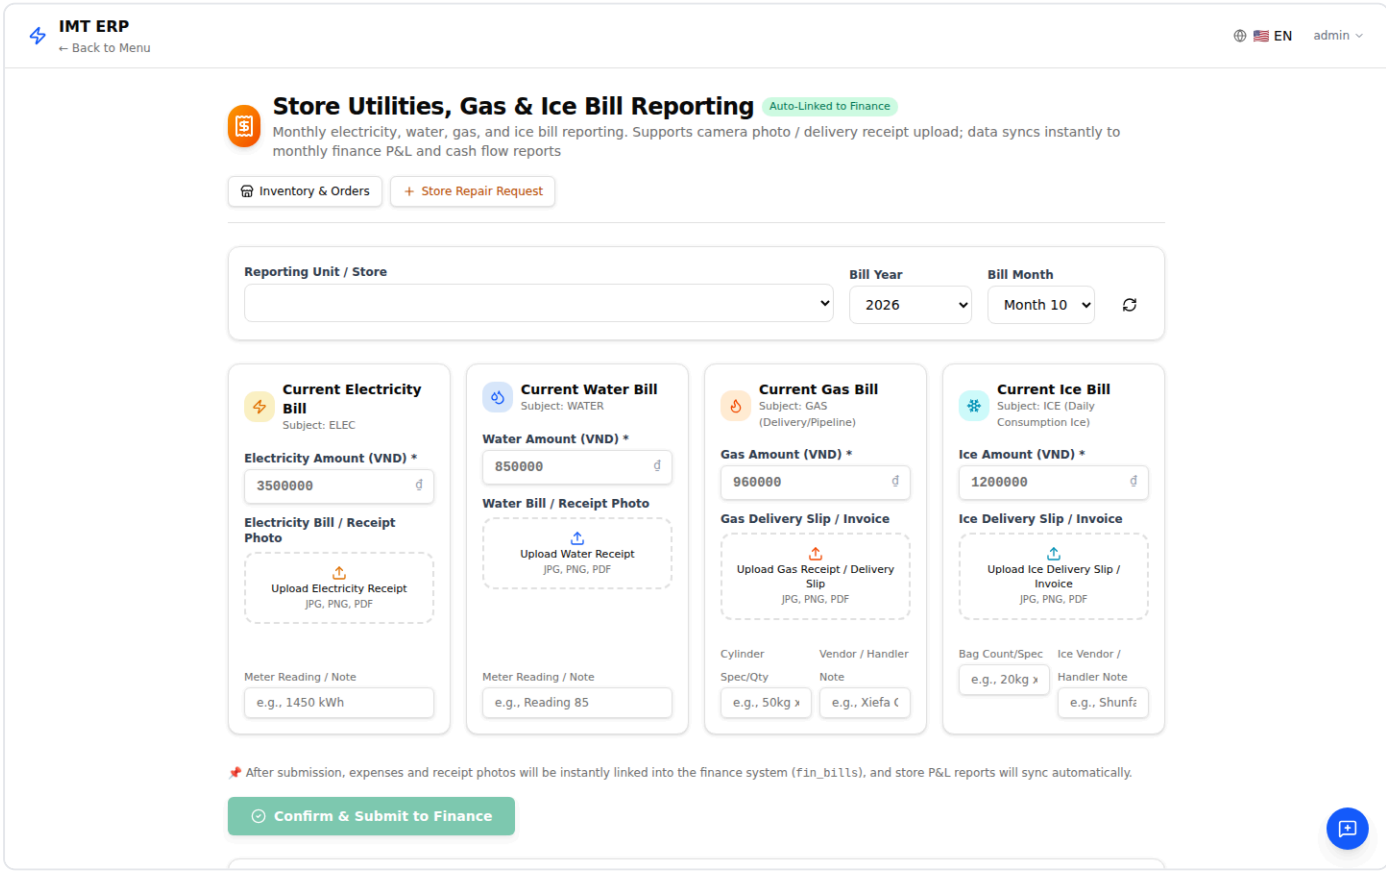

- **Safety Qty**: the urgent reorder line; below it, the foreman is notified.
- **Full Qty**: the target that daily orders top up to.
- Set them with "Load Material List" or "Import (.xlsx)".
- "Festival Overrides" lets you use different safety and full quantities for a date range (for example Mid-Autumn).

Notification Settings

Enter the Telegram chat id or email for Foreman/Store Staff, Management, Audit and Office, and how many days before expiry each role is notified. If an item expires without being scrapped, Management, Audit and Office are also notified. The system checks once a day; click "Check Expiry Now" to check immediately.

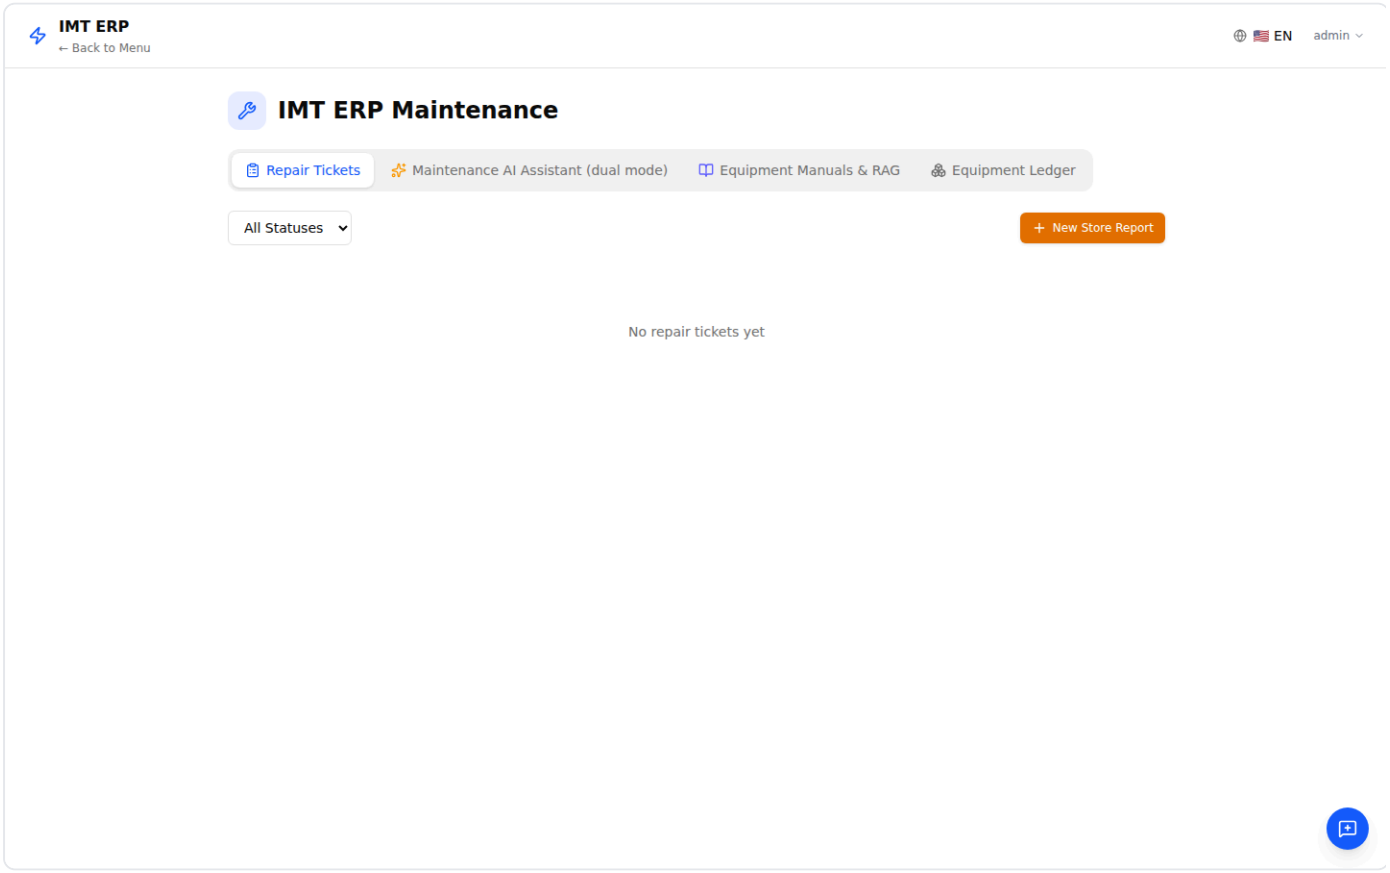

Utility Bills

1. Choose the store, year and month.
2. Electricity, water, gas and ice each have a card. Enter the amount (VND) and upload the bill, receipt or delivery slip (JPG, PNG, PDF; on a phone you can take a photo). You can also enter meter readings, cylinder or bag counts and supplier notes.
3. Click "Confirm & Submit to Finance". The bills and receipts go straight to Finance and the store's profit and loss updates.
4. Below, the bills already submitted for the month are listed with their source (store or supplier) and receipts.

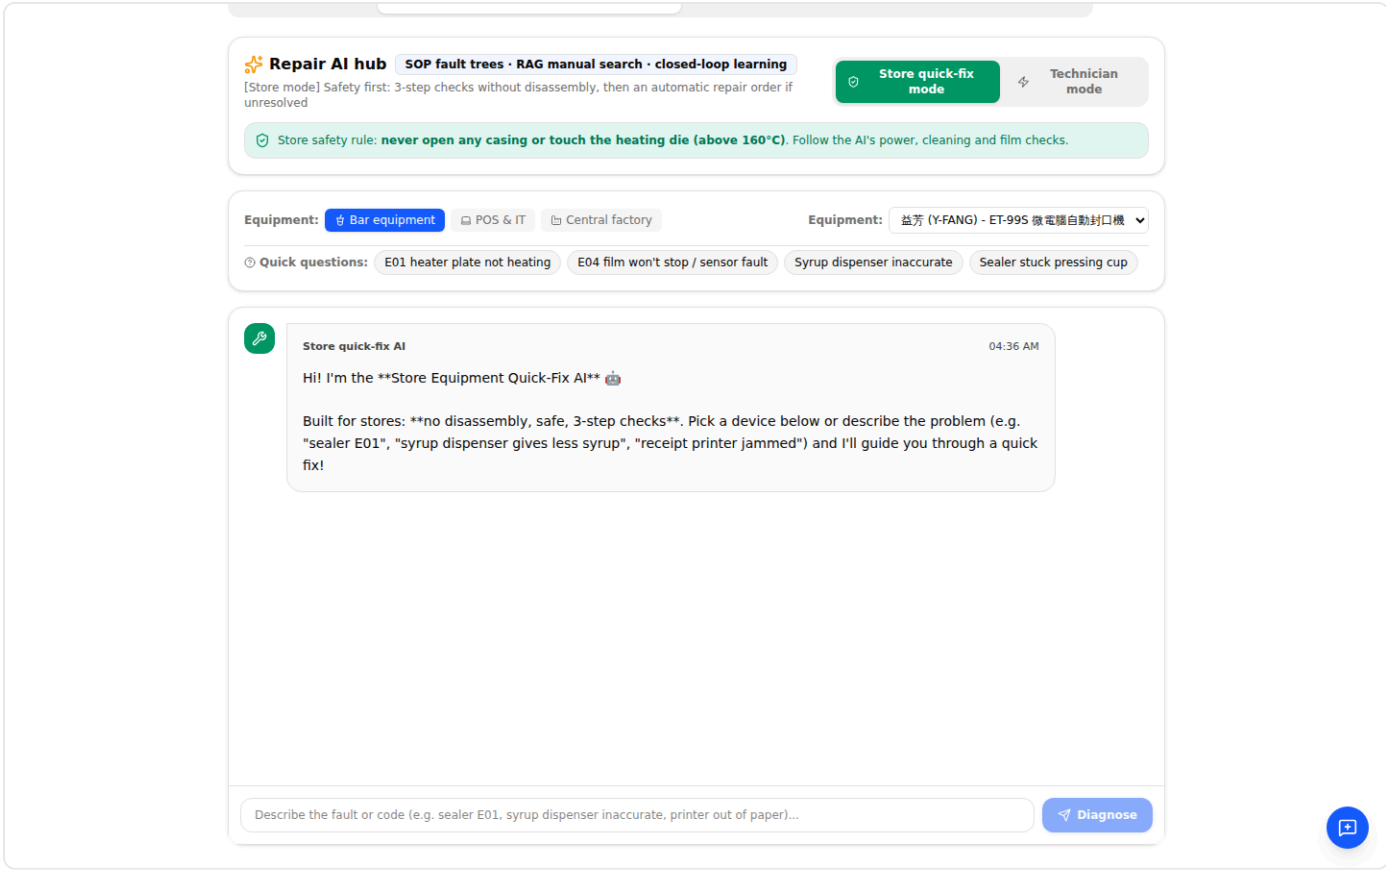

Submitting again for the same store, month and bill type replaces the earlier amount.

Store Repairs

Repair Tickets

1. Click "New Store Report" and enter the problem title, store, related equipment, priority (Low, Normal, High, Urgent) and a description.
2. Tickets move through Reported, Assigned, In Progress, Done or Cancelled.
3. The person handling it can assign an outside vendor or an employee, and record the cost and outcome.

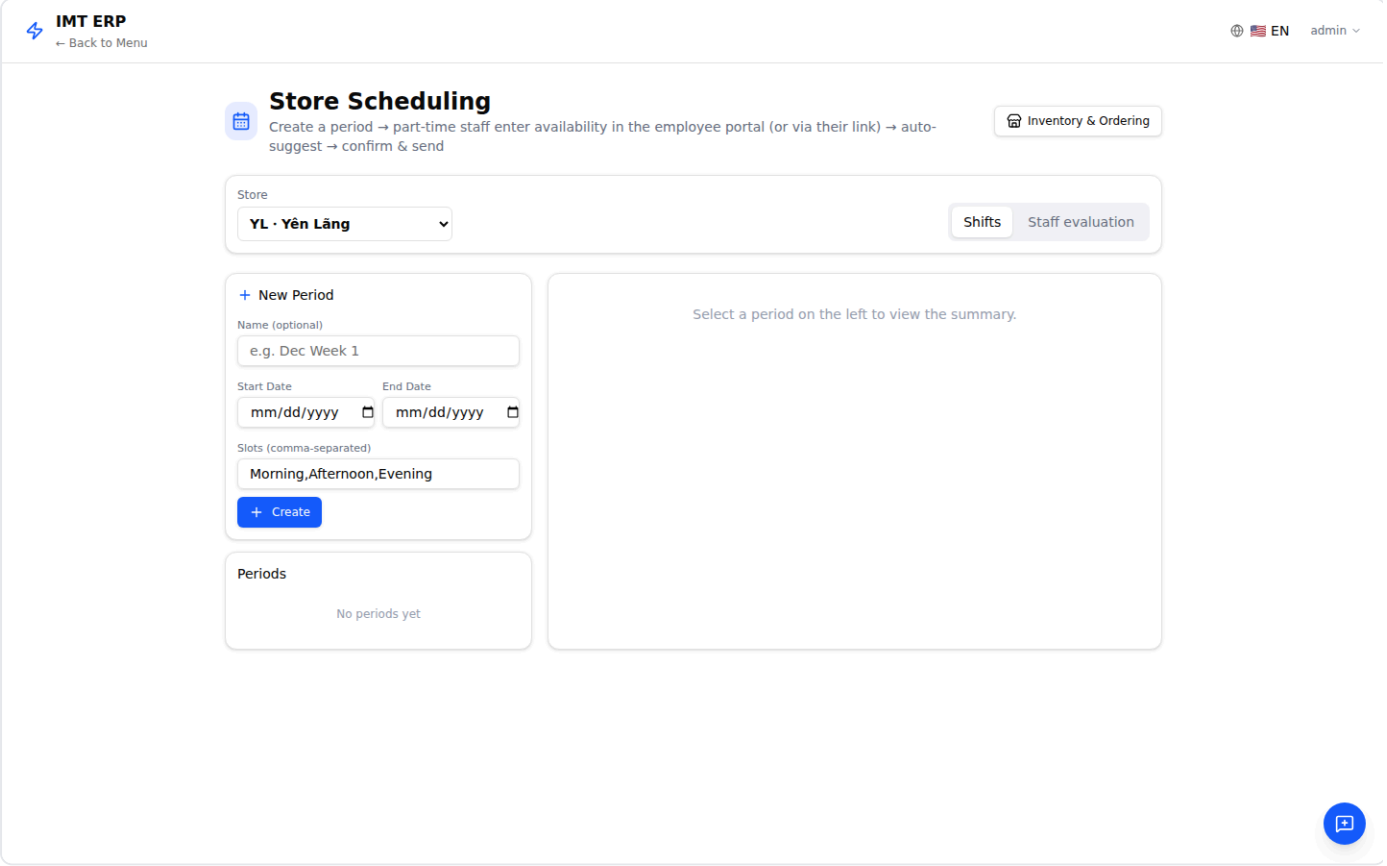

Maintenance AI Assistant (dual mode)

- **Store quick-fix mode**: safety first, three no-disassembly checks for problems such as sealer E01/E04, syrup dispenser inaccuracy, printer paper jams or a cash drawer that won't open. Common problems are listed for one-click use.
- **Technician mode**: electrical measurements, original part numbers and repair history.
- If the checks don't fix it, AI drafts a repair ticket; click "Submit repair order" to send it.

Equipment Manuals & RAG: original manuals, wiring diagrams, error code tables and technicians' repair notes, which make AI's answers more accurate over time.

Equipment Ledger: record each item's name, store, category, brand and model, serial number, purchase date, warranty end and location. The system shows how long the warranty has left or how long ago it expired.

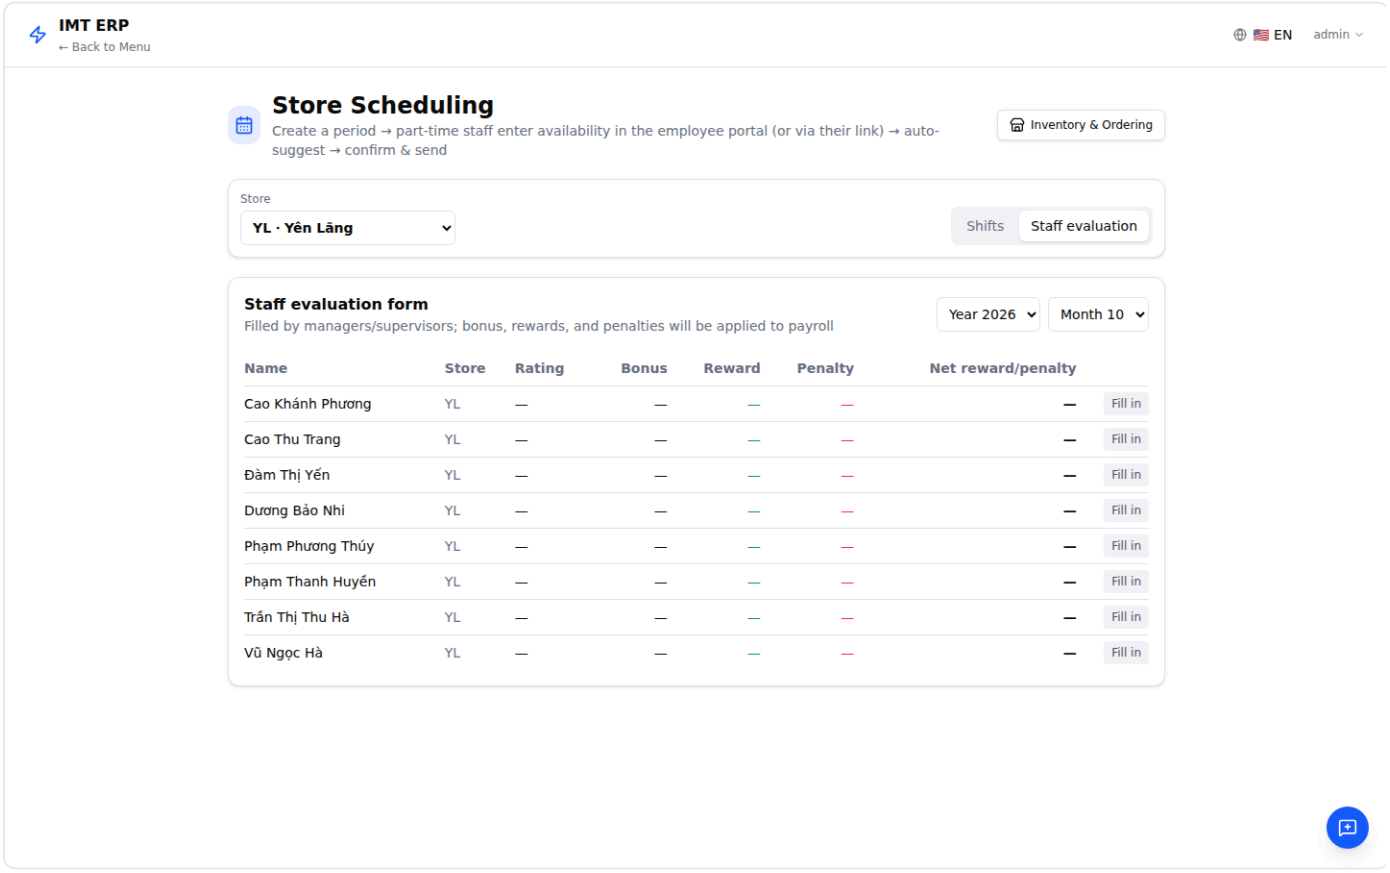

Store Scheduling

1. Pick the store from the dropdown and click "New Period". Enter a name, start and end dates and the shifts (morning, midday, evening by default). The store's active staff are added automatically.
2. Part-time staff (employment type part-time in HR) log in to their own employee portal at `/e/<attendance number>`, click the fill-in button on the availability card, tick the dates and shifts they can work and submit; they can change it later. You can also click "Copy submission link" and send each person their own link. The page shows how many have submitted.
3. Set "Needed per slot" and click "Auto Suggest". The system builds a schedule that balances each person's total shifts.
4. Click a name to assign or unassign. Grey means available but not scheduled; blue means scheduled.
5. Click "Confirm & Send". The schedule is locked and emailed to staff, and part-time staff also see their shifts on the same card in the employee portal. To change it later, create a new period.

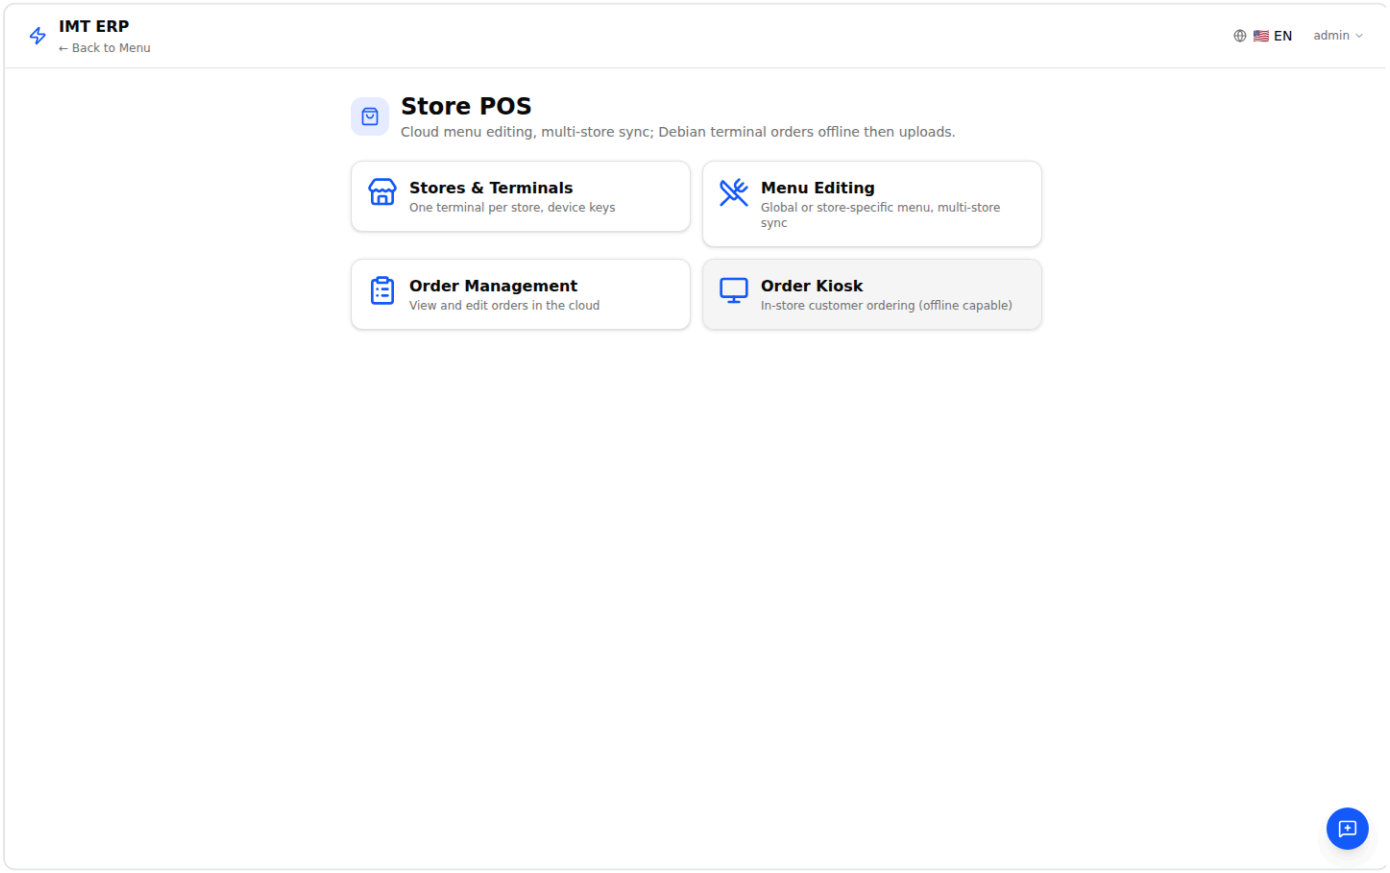

You can also use "Bulk Import Schedule (Excel/CSV)". Staff must first be set up in HR with their store and attendance number. Part-time staff who join after a period was created are counted as submitted once they submit in the employee portal.

Staff Evaluation

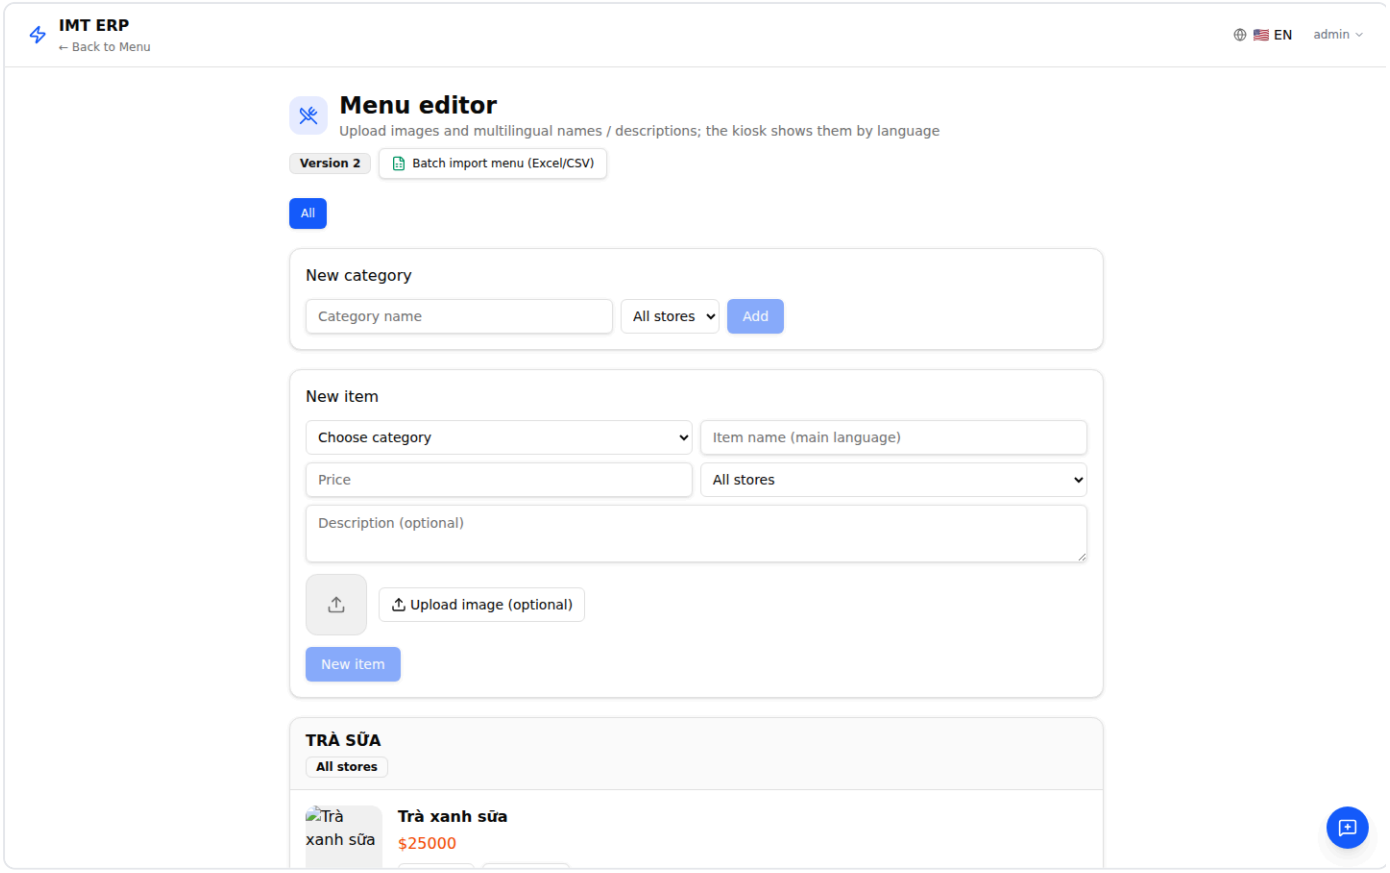

Switch to the "Staff evaluation" tab at the top right to list the active staff of the selected store. Choose the year and month and click the fill-in button to enter the rating, bonus, reward and penalty items and comments. This is the same evaluation sheet as in HR and feeds into payroll. Store Leaders can only evaluate staff of their own store; Excel bulk import is only on the HR page.

Store POS

Feature	What it does
Stores & Terminals	One Debian terminal per store; shows the device key (device_key) and last sync time
Menu Editing	Company-wide or store-specific menus, synced to all stores
Order Management	View and edit orders in the cloud (dine-in, takeaway, delivery)
Order Kiosk	Customer ordering at the store; works offline and uploads when back online

Menu Editing

1. "New category": enter the name and choose company-wide or a specific store.
2. "New item": choose the category, enter the name, price and description, and optionally upload an image.
3. Under "Languages", enter the name and description in each language or click "AI translate"; the kiosk shows the customer's language.
4. Items can be disabled, enabled or removed. For many items, use "Batch import menu (Excel/CSV)".

Stores & Terminals

After adding a store, enter the terminal's device_key in the kiosk or pos-bridge so the terminal can sync the menu and upload orders. Keep the key private.

FAQ and notes

Can't open the Store system? Your account must belong to the Store unit (or Store Leader, which can only use scheduling). Ask an administrator to add it in the unit settings or the HR record.

Why can't I switch to another store? The account is set to "own store only"; this is by design. If a manager runs several stores, ask HR to tick them under "Managed stores (multiple)" in the employee record.

Reports, counts or variance analysis show no data? Pick the store in Store Reports and import that month's POS and inventory files. Variance analysis also needs recipes and product mapping.

No alert when stock goes below safety level? Check that the foreman's Telegram chat id or email is filled in under Notification Settings and that safety stock is set.

Need to change a bill after submitting? Choose the same store and month, change the amount or replace the receipt, and submit again.

Can I follow AI diagnoses and troubleshooting steps as is? AI is support only. Store staff should not handle anything involving electricity, heat or taking equipment apart; submit a repair request so a technician can deal with it.
